Kaziranga National Park

2017 Conservation Outlook Assessment

SITE INFORMATION

Country:
India
Inscribed in: 1985
Criteria:
(ix) (x)

Site description:

In the heart of Assam, this park is one of the last areas in eastern India undisturbed by a human presence. It is inhabited by the world's largest population of one-horned rhinoceroses, as well as many mammals, including tigers, elephants, panthers and bears, and thousands of birds.
© UNESCO
SUMMARY

2017 Conservation Outlook

GOOD WITH SOME CONCERNS

Finalised on 10 Nov 2017

The Kaziranga National Park is considered as one of the better managed Protected Areas in the country and elsewhere, owing both to its enabling framework and demonstrable success in conservation. There has been no significant deterioration in its values over the years and the natural attributes are likely to continue their healthy trend at least in the medium term. However, after decades of conservation success the recent spike in rhino poaching in the site is of particular concern. The changing dynamics of the surrounding landscape, particularly with regard to the anthropogenic elements, will be placing increasing pressure on the ecological integrity of the site. Both of these are areas of concern. However, overall protection and management of the park remains effective, and as long as it will be able to implement adaptive management strategies to deal with the intensification of threats the park is likely to continue to achieve the conservation of its values into the foreseeable future.

Current state and trend of VALUES

Low Concern
Trend: Stable

The current state of the site’s values with regard to its ecological processes and significant natural habitat is good and stable. After decades of conservation success the recent spike in rhino poaching in the site is of significant concern. However, historically the park has demonstrated to be resilient to such levels of rhino offtake. Under continued high levels of protection, the park is likely to maintain its high levels of biodiversity.

Overall THREATS

High Threat

Major threats to Kaziranga primarily affect its significant natural habitat and its
rare and endangered species. Rhino poaching, spread of invasive species (Mimosa), livestock grazing, highway traffic, unplanned tourism infrastructure and seasonal flooding are current threats which have direct bearing on the wildlife and its habitat. Likewise, potential threats to the site which may pose challenge include the changing demographic and economic profile of the local population, illegal fishing and stone quarrying adjacent to the park, tourist pressure and river bank erosion. The predominantly anthropogenic drivers of these threats have long-term implications for the site from a conservation perspective. The location of various threats is both inside and outside the site.

**Overall PROTECTION and MANAGEMENT**

*Mostly Effective*

The property has the highest legal protection and strong legislative framework under Indian wildlife laws. The park has a long history of protection reflected in the dramatic recovery of the rhino population and celebration of 100 years of conservation in 2005. The park has also been declared as a Tiger Reserve (2007) and there have been six additions to the park area. The site benefits from government support at both national and regional levels as well as involvement of national and international conservation organisations. However, there remain some issues of concern particularly with regard to developing a more cooperative and economically beneficial relationship for the local population. The management also needs a long-term strategy for dealing with tourism related issues, research and monitoring for habitat and wildlife, human-wildlife conflicts and boundary issues relating to the addition areas to the national park. Staff training and development will require continued attention of the management. While adequate and sustained finance is a critical requirement, the constitution of the Kaziranga Tiger Conservation Foundation is a landmark measure in this regard.
FULL ASSESSMENT

Description of values

Values

World Heritage values

► Ecological processes in development of terrestrial and freshwater ecosystems
  Criterion:(ix)

The Brahmaputra River’s fluctuations result in spectacular examples of riverine and fluvial processes (IUCN, 1985). River bank erosion and formation of new lands determined by the Brahmaputra river system; succession between grasslands and woodlands. Three-quarters or more of the area is submerged annually by the flood waters of the Brahmaputra. Soils are alluvial deposits of the Brahmaputra and its tributaries. (WHC website, retrieved 2014).

► Significant natural habitat
  Criterion:(x)

The park represents one of the last unmodified natural areas of this region of India (IUCN, 1985). It is the single largest undivided and representative area of the Brahmaputra valley floodplain grasslands and forests with associated biodiversity. There are three main types of vegetation: alluvial inundated grasslands, tropical wet evergreen forests and tropical semi-evergreen forests. Grasslands predominate in the west, with tall 'elephant' grasses on the higher ground and short grasses on the lower ground surrounding the bheels. Tropical wet evergreen forests, near Kanchanjhuri, Panbari and Tamulpather blocks, are dominated by trees. Tropical semi-evergreen forests occur near Baguri, Bimali and Haldibari. (WHC website, retrieved
The park is internationally recognized for the single largest population of the Great Indian One-horned Rhinoceros Rhinoceros unicornis, some $\frac{3}{4}$th of its total world population. Current estimates indicate that apart from over 2000 rhino population, the park is also home to the single largest population of Asiatic wild buffalo, eastern swamp deer and sizeable population of Asian elephant. The property has recently recorded the highest ecological density of the Royal Bengal tiger in the country. The park contains about 15 species of India’s threatened (Schedule I) mammals (Retrospective SoOUV, 2015).

The park plays an important role in avifaunal conservation due to its location at the junction of Australasia & Indo-Asian flyway. The birds’ check-list of the park includes more than 480 species. The wetlands of the park play a crucial role for conservation of globally threatened bird species by providing the necessary habitat during their annual migrations (Retrospective SoOUV, 2015). The park holds significant populations of threatened resident avifauna including the Bengal florican (Houbaropsis bengalensis), long-billed vulture (Gyps tenuirostris), spot-billed pelican (Pelecanus phillipensis), and lesser adjutant stork (Leptoptilos javanicus).

The site lies within a Conservation International-designated Conservation Hotspot, a WWF Global 200 Eco-region, and is one of the world’s Endemic Bird Areas (WCMC Datasheet, 2011).
Assessment information

Threats

Current Threats

High Threat

Significant current threat to Kaziranga is rhino poaching, with implications beyond the park and the country. While poaching is not a new phenomenon, there are phases of high and low levels of poaching. The spurt in such incidents since 2012 is a cause of concern. Spread of alien invasive plant species, esp. Mimosa, are a clear threat to the characteristic grassland habitat of the park. Livestock grazing inside the park has affected the habitat and also hybridization of wild buffalo. The highway along the southern boundary of the property is witnessing heavy traffic load with consequent barrier to animal migration routes and wildlife casualty. Likewise, unplanned tourism infrastructure in the vicinity of the park has affected animal movement in wildlife corridor zones.

Storms/Flooding

▶ Low Threat

Inside site, throughout (>50%)
Outside site

Severe losses to wildlife are sustained during heavy floods. The monsoon flooding of 2004 was said to be the worst for 50 years, with widespread loss of animals (WCMC, 2011). During the floods in 2017, around 104 animals (95 hog deer, 7 rhinos and 2 elephants) were handled by the IFAW-WTI run Centre for Wildlife Rehabilitation and Conservation (CWRC) of which 80 were released back into the wild. The park lost more than 300 animals in two waves of floods in 2017 (Assam Forest Department data).

Livestock Farming / Grazing

▶ Low Threat

Inside site, extent of threat not known
Outside site

Problem of interbreeding of domestic buffalo with the wild buffalo population is a problem (SOC, 2008). The illegal presence of grazing water buffalo contributes to the spread of rinderpest and has resulted in hybridization of the wild stock (WCMC, 2011).

► **Housing/ Urban Areas**
- **Low Threat**
- **Outside site**

Tourism infrastructure has mushroomed along the park boundary and could hinder animal movement in wildlife corridor zones. A number of awareness activities by the Forest Department has been launched in the surrounding areas in the recent past. While not addressing tourism infrastructure per se, this will help in alleviating wildlife unfriendly practices in the area.

► **Commercial hunting**
- **High Threat**
- **Inside site, widespread (15-50%)**
- **Outside site**

Poaching of rhinos is a significant threat to Kaziranga National Park. (MEE, 2007). Poaching within and adjacent to the property is a concern. (SOC, 2008). Poaching of rhinoceros for its horn by heavily armed hunters is profitable (WCMC, 2011). There was a decreasing trend of rhino poaching from 2007 to 2011 (SP Report, 2012); however, in the last two years (2015 and 2016) 35 rhinos were poached showing a relative surge in poaching activity in and around the park. Nevertheless, numbers of rhino poached are still lower than they were in the early 1990s (IUCN Stakeholder consultation, 2017).

► **Invasive Non-Native/ Alien Species**
- **Low Threat**
- **Inside site, scattered (5-15%)**
- **Outside site**

Infestation by the alien mimosa weed, Mimosa invisa and M. inermis, has blanketed the native vegetation over about 5% of the Park and requires constant clearing (WCMC, 2011). Although park authorities and the Wildlife
Trust of India have cleared mimosa from most of the park (IUCN Stakeholder consultation, 2017), there is still some concern and the efficacy of the efforts undertaken, including manual uprooting and controlled burning, have yet to be scientifically assessed (SOC, 2011).

**Potential Threats**

**Low Threat**

Changing demographic and economic profile of the population around the site could have potential consequences for support to conservation. Illegal fishing in the park fringes and stone quarrying in the adjacent hills disturbs the natural landscape. Increased tourist flow will put additional pressure on park visits as well as on tourism infrastructure around the park. Erosion of land along the northern boundary of the park by river flow could have adverse implications for park area in future.

▶ **Mining/ Quarrying**

- **Data Deficient**
- **Outside site**

Stone quarrying in the foothills of Karbi Anglong remains an issue that is currently sub-judice in Indian courts. While this causes disturbance to migrating elephants, the corridors themselves are relatively free of this threat.

▶ **Fishing / Harvesting Aquatic Resources**

- **Very Low Threat**
- **Outside site**

Illegal fishing in adjacent areas of the park (MEE, 2007; WCMC, 2011).

▶ **Erosion and Siltation/ Deposition**

- **High Threat**
- **Inside site**

River bank erosion is caused by the Brahmaputra river along the northern boundary of the property. This natural factor could have adverse implications on the property in the future. This is a real problem as nearly 30 sq.km. area
of original 430 sq.km. has been eroded since inscription (SP Report, 2012).

▶ **Identity/ Social Cohesion/ Changes in local population and community**

*Low Threat*

*Outside site*

---

**Protection and management**

---

**Assessing Protection and Management**

▶ **Relationships with local people**

*Some Concern*

The park is faced with increasing pressures as a result of rapid changes in the surrounding landscape, related to increasing population pressure and agricultural development (SOC, 2008). Human-Wildlife conflict, including damage to crops, property and human lives, remains a conservation issue (SP Report, 2011). Community eco-development projects have been aimed more at the protection of animals and providing infrastructure than in helping communities directly, and there has been a lack of consultation and of an open planning process (WCMC, 2011). Resource dependency (fishing, grazing, thatch and fuelwood collection) and denial of traditional access to resources are leading to disturbance (MEE, 2007). There is a feeling of land alienation owing to planned inclusion of ‘Addition Areas’ from the fringe areas as part of the Park. However, more recently, some proactive measures have been taken by the park that aim to reverse these trends, including the engagement of local youths as casual workers and tourist guides, the recruitment of volunteers during floods to avert traffic accidents involving wild animals along the NH 37, and the establishment of Village Defense Parties, which consist of groups of local youths who guard areas outside the park from potential intruders and keep watch on large mammals crossing
over to human habitation and tea gardens (Rhino Task Force Report, 2015).

▶ Legal framework and enforcement
   Highly Effective

Kaziranga was originally proposed as a reserved forest in 1905 and designated a reserved forest in 1908 with the object of preserving the rhinoceros and other large mammals. The killing of rhinoceros was made punishable by the Assam Rhinoceros Preservation Act of 1954, reinforced by the Biodiversity Conservation act of 2002. Twelve Acts have been passed to safeguard conservation of the Park’s lands and animals. No rights or privileges to exploit forest produce are exercised. Limited grazing was permitted until the area was finally declared a National Park. (WCMC, 2011). The property has highest legal protection and strong legislative framework under the provisions of Indian Wildlife (Protection) Act, 1972 and Indian Forest Act, 1927/Assam Forest Regulation 1891. The park has a long history of protection reflected in the dramatic recovery of the rhino population and celebration of 100 years of conservation in 2005.

▶ Enforcement
   Mostly Effective

Despite the high threat of rhino poaching, enforcement at Kaziranga is keeping the numbers poached relatively low due to constant intelligence and surveillance techniques (IUCN Stakeholder consultation, 2017).

▶ Integration into regional and national planning systems
   Highly Effective

It is well integrated into national planning system as a National Park and Tiger Reserve under the National Tiger Conservation Authority, and part of an Elephant Reserve under the Ministry of Environment and Forests, Government of India.

▶ Management system
   Mostly Effective

The forest department of the Government of Assam is responsible for the management of the national park. There has been a series of ten-year
management plans from 1981, supplemented by annual plans of operation (UNEP-WCMC, 2011).

▶ **Management effectiveness**

**Mostly Effective**

Kaziranga is one of the better managed parks in India, but improved management, financial and technical support, and community strategy, awareness, education and involvement in planning are all still necessary (WCMC, 2011).

▶ **Implementation of Committee decisions and recommendations**

**Mostly Effective**

▶ **Boundaries**

**Some Concern**

There have been continuing efforts at strategic extensions to the national park in order to address issues of integrity affecting the existing property (32COM 7B.12, 2008). Since the inscription of the property, the national park was extended several times, increasing its size from the original 42,996 ha to 85,942 ha today, including the river and floodplain areas, as well as strategic wildlife corridors to the Karbi Anglong hills. These extensions have not yet been added to the inscribed World Heritage property, as there are still some court cases contesting some of the additions and these have to be concluded before any proposal for extension can be submitted. While important areas of the hills are protected as forest reserves, plans to create a wildlife sanctuary and even to include some of these critical areas in the national park have not yet been implemented. (SOC, 2008). An area of 70 sq. Kms adjacent to the Kaziranga National Park and World heritage Site in the District of Karbi Anglong has already been processed in order to give status of Wildlife Sanctuary, viz, North Karbi Anglong Wildlife Sanctuary. (SP Report, 2009). The process of issuing final notification is still going on. (SP Report, 2011). All the 6 Additions to Kaziranga National Park have been notified as buffer. The World Heritage Site also became core area of Kaziranga Tiger Reserve in
2007 with total area of 1030 sq. km. (SP Report, 2012).

► Sustainable finance
Some Concern

Park management pointed to the lack of staffing and budget, in particular the unavailability of funds sanctioned under the central funding schemes, with funds held up at the level of the State Government. (SOC, 2008). Funding for the management of the property is normally done by the Govt. of Assam under the schemes: (i) Development of National Park & Wildlife Sanctuaries and (ii) Development of other Wildlife areas. Funding has improved with the Central Assistance of Govt. of India under Project Elephant and the Project Tiger since 2008-09. (SP Report, 2009). With the declaration of the park as “Tiger Reserve” in 2007, it has started receiving additional financial support since 2008-09 under ‘Project Tiger’ scheme. (SP Report, 2011). In addition, the park receives support in cash and in kind from a range of national and international NGOs.

► Staff training and development
Some Concern

Kaziranga has a reasonably well-trained force of forest guards, which have received academic training in Forester School and Forest Guard School, as well as skill development training, including anti-poaching and other field level training. Much of this training is being provided by NGOs such as Aaranyak, Wildlife Trust of India, and WWF-India (IUCN Stakeholder consultation, 2017). However, according to the Rhino Task Force Report (Government of India, 2015), the lack of training in jungle warfare, target practice, as well as knowledge of the terrain and ecological acquaintance with the park are considered to be severe inadequacies in the effective performance of Kaziranga’s field personnel.

► Sustainable use
Data Deficient

There is absence of information on any assessment of sustainable resource use in and around the site. However, livestock grazing (SOC, 2008), illegal fishing (MEE, 2007) and stone quarrying (WCMC, 2011) are present resource
use threats outside the boundaries of the site.

► **Education and interpretation programs**  
**Some Concern**

There is a lack of specific education and awareness programmes highlighting the values of the site. A new joint venture of the Assam Forest Department and the Wildlife Trust of India is underway to establish the Kaziranga Discovery Park, and construction has started on an interpretation centre at Panbari, adjoining the park (IUCN Stakeholder consultation, 2017).

► **Tourism and interpretation**  
**Mostly Effective**

The site is highly promoted in local and national tourism policies. Tourist routes are earmarked for visitors. Adequate visitor services are available. Tourist facilities around the park are in high demand, due to the large number of tourists that visit the property every year. (SOC, 2011). Uncontrolled tourism is also a problem. (WCMC, 2011).

► **Monitoring**  
**Mostly Effective**

The values of the site are periodically monitored as per Management Plan.

► **Research**  
**Some Concern**

Numerous research projects are undertaken in the park mostly by academic or other research centres and NGOs. However, there is no overall research strategy or focus.

**Overall assessment of protection and management**  
**Mostly Effective**

The property has the highest legal protection and strong legislative framework under Indian wildlife laws. The park has a long history of protection reflected in the dramatic recovery of the rhino population and celebration of 100 years of conservation in 2005. The park has also been declared as a Tiger Reserve.
(2007) and there have been six additions to the park area. The site benefits from government support at both national and regional levels as well as involvement of national and international conservation organisations. However, there remain some issues of concern particularly with regard to developing a more cooperative and economically beneficial relationship for the local population. The management also needs a long-term strategy for dealing with tourism related issues, research and monitoring for habitat and wildlife, human-wildlife conflicts and boundary issues relating to the addition areas to the national park. Staff training and development will require continued attention of the management. While adequate and sustained finance is a critical requirement, the constitution of the Kaziranga Tiger Conservation Foundation is a landmark measure in this regard.

Assessment of the effectiveness of protection and management in addressing threats outside the site

Some Concern

The protection and management system is confronted with many of the threats which originate outside the site. The changing demographic and economic profile of the population around the fringe of the park is a particular challenge and the park’s attempts at eco-development for the communities are yet to yield the desired results. The management is also limited in its mandate to control stone quarrying and unplanned tourism infrastructure though the park is part of a larger government committee seeking to regulate such development. There is considerable success in checking illegal grazing of livestock. The park has instituted measures to slow down high speed traffic along the highway near the park; however, the volume of traffic is beyond the control of the park. In recent years, the linkage of rhino poaching to wider national, regional and global markets is of very serious concern to the localized protection and management system.

Best practice examples

The Centre for Wildlife Rehabilitation and Conservation (CWRC) run by the Assam Forest Department with IFAW and WTI for the last ten years is a centre of excellence of veterinary and rescue and rehabilitation practices having released back into the wild close to 5000 rescued animals including
rhinos, tigers, elephants, hog deer etc. (IUCN Stakeholder consultation, 2017).

State and trend of values

Assessing the current state and trend of values

World Heritage values

▶ Ecological processes in development of terrestrial and freshwater ecosystems
  Low Concern
  Trend: Stable

River bank erosion is caused by the Brahmaputra river along the northern boundary of the property. This natural factor could have adverse implications on the property in the future. This is a real problem as nearly 30 sq.km. area of original 430 sq.km. has been eroded since inception (SP Report, 2012).

▶ Significant natural habitat
  Good
  Trend: Stable

The floodplain grasslands and forests of Kaziranga remain in healthy condition and are constantly evolving in the dynamic ecosystem.

▶ Rare and endemic mammals
  Low Concern
  Trend: Stable

Despite poaching of rhinos presenting a significant threat to Kaziranga National Park, the site still holds more than three quarters of the global greater one-horned rhino population as well as significant numbers of hog deer, swamp deer, Asiatic elephant, wild buffalo and tiger. Kaziranga has one of the highest densities of large mammals in all of India (IUCN Stakeholder consultation, 2017).

▶ Rare and endemic birds
  Good
  Trend: Stable
The site remains an avian paradise for globally threatened bird species, including both residential and migratory categories.

Summary of the Values

▶ Assessment of the current state and trend of World Heritage values

Low Concern

Trend: Stable

The current state of the site’s values with regard to its ecological processes and significant natural habitat is good and stable. After decades of conservation success the recent spike in rhino poaching in the site is of significant concern. However, historically the park has demonstrated to be resilient to such levels of rhino offtake. Under continued high levels of protection, the park is likely to maintain its high levels of biodiversity.

Additional information

Benefits

Understanding Benefits

▶ Sacred natural sites or landscapes

It is regarded as one of the finest wildlife refuges in the world and a veritable storehouse of biodiversity. The park is internationally recognized for the single largest population of the Great Indian One-horned Rhinoceros Rhinoceros unicornis, some ¾th of its total world population. Current estimates indicate that apart from over 2000 rhino population, the park is also home to the single largest population of Asiatic wild buffalo, eastern swamp deer and sizeable population of Asian elephant. The property has recently recorded the highest ecological density of the Royal Bengal tiger in the country. The park contains about 15 species of India’s threatened
Outdoor recreation and tourism

The site is a hub of recreation and tourism attracting local, national and global visitors.

Carbon sequestration

The natural values of the site provides ideal habitat for climate change mitigation.

Flood prevention

The site is endowed with high wetland values and acts as a sink in the Brahmaputra valley floodplains.

Summary of benefits

The major benefits of Kaziranga are provided by its nature conservation and wilderness values which can be availed by the community outside the site as well as the wider global community. It is a significant representative of unique biodiversity characterized by floodplain grasslands and forests. Apart from being the home of the single largest population of the Greater One-Horned Rhinoceros in the world, it harbours substantial number of other mega fauna and threatened species. These attributes further make it one of the most important sites for recreation and tourism. However, benefits of the site’s flood prevention and climate change mitigation potential are not yet fully exploited and more scientific information is required on these issues.
