Sian Ka'an

SITE INFORMATION

Country:
Mexico
Inscribed in: 1987
Criteria:
(vii) (x)

Site description:
In the language of the Mayan peoples who once inhabited this region, Sian Ka'an means 'Origin of the Sky'. Located on the east coast of the Yucatán peninsula, this biosphere reserve contains tropical forests, mangroves and marshes, as well as a large marine section intersected by a barrier reef. It provides a habitat for a remarkably rich flora and a fauna comprising more than 300 species of birds, as well as a large number of the region's characteristic terrestrial vertebrates, which cohabit in the diverse environment formed by its complex hydrological system.

© UNESCO
SUMMARY

2014 Conservation Outlook

Good with some concerns

Even though some of the threats to Sian Ka'an are buffered by the large size of the property and many encouraging management efforts the long list of current threats is of concern. Among the key concerns on land are the direct and indirect impacts of mass tourism development, such as infrastructure, excessive freshwater use, contamination and waste. However, the challenges are well understood and appear manageable. In the medium and longer term, widespread rural poverty is likely to take its toll on the natural resources. The conservation outlook for the marine and coastal environments is even more challenging in terms of management due to the combination of local factors and factors beyond the control of site management. Namely, increased sea levels and temperatures and related ocean acidification due and the invasion of Lionfish will require responses beyond Sian Ka'an.

Current state and trend of VALUES

Low Concern
Trend: Deteriorating

Due to its large size and relatively difficult access, large parts of the property continue to be in a good state of conservation. Despite an overall good state of the World Heritage values related to natural beauty, there is a concern with respect to the coastal zone, which is affected by uncontrolled development and plastic debris. Key concerns in terms of overall trends are the depletion and contamination of freshwater resources and the uncontrolled use of certain marine and terrestrial species.

Overall THREATS

High Threat

Out of the large number of current threats coastal development, mostly related
to tourism, stands out as a major concern with multiple direct and indirect impacts on land and in the sea, including pressure on species, disturbance, depletion of freshwater and sewage and waste. There are clear indications that the marine and coastal environments may be severely affected by expected sea level rise and the effects of anticipated temperature increases and related ocean acidification on reefs and other marine ecosystems.

**Overall PROTECTION and MANAGEMENT**

*Some Concern*

The establishment of Sian Ka'an has made a marked difference on a coastline massively transformed since the arrival of mass tourism. At the same time, the property is not immune to the direct and indirect impacts of such broader developments and management has little influence on such developments. However, the challenges are well understood and significant efforts are being undertaking to overcome them.
FULL ASSESSMENT

Description of values

Values

World Heritage values

► Scenic beauty of mosaic of landscape elements
   Criterion: (vii)

   The aesthetics and beauty of Sian Ka´an derive from the relatively undisturbed interface of sea and land along a comparatively well-conserved coastline. The mosaic of landscape elements is diverse in shapes, forms and colours allowing intriguing views and impressions. Noteworthy and rare natural phenomena include the "Cenotes", water-filled natural sinkholes hosting specialised communities of life and the "Petenes", tree islands emerging from the swamps (SoOUV, 2013).

► Fascinating variety of life forms
   Criterion: (x)

   The scale and conservation status of Sian Ka'an and its ecosystem diversity support a fascinating range of life forms. Over 850 vascular plants, including 120 woody species, have been confirmed in what is assumed to be a still incomplete inventory. In terms of fauna, noteworthy representatives among the more than 100 documented mammals include endangered species like Black-handed Spider Monkey, Yucatan Black Howler Monkey and the Central American Tapir. A small population of the vulnerable West Indian Manatee occurs in the coastal waters. Some 330 bird species have been recorded, 219 of them breeding in Sian Ka'an. Amphibians and reptiles are represented by more than 40 recorded species, among them the vulnerable American Crocodile and four of the six turtle species found along the Mexican coast, all
reproducing within the property. The isolation of some of the "Cenotes" led to the evolution of several species which are locally endemic to single sinkholes. With some 80 recorded species of reef-building coral the portion of the Mesoamerican Reef within the property is one of the richest in Mexico. Jointly with the many other aquatic habitats it harbours more than 400 species of fish and a wealth of other marine life (SoOUV, 2013).

Other important biodiversity values

▶ Other international designations

The Park lies within a Conservation International-designated Conservation Hotspot, a WWF Global 200 Eco-region, and both a Ramsar Wetland of International Importance and a UNESCO Biosphere Reserve (WDPA, 2011).

▶ Integral component of the system of mangroves, seagrass beds and coral reefs of Mesoamerica

It deserves to be noted that Sian Ka'an belongs to an important and relatively intact part of the Mesoamerican Reef, a marine area of global conservation significance. The reef has attracted a lot of national and international attention. It is functionally and ecologically linked with the coastal mangroves and the seagrass beds. In this context, it is noteworthy that the property is part of a larger conservation complex which is contiguous with two additional protected areas, "Área de Protección de Flora y Fauna Uaymil" and "Reserva de la Biosfera Arrecifes de Sian Ka'an". Despite the slightly confusing identical name the latter protected area established to conserve the coral reefs is not part of Sian Ka'an Biosphere Reserve and also not included in the World Heritage property.

Assessment information

Threats
Current Threats
High Threat

The greatest current threats are a combination of the direct and indirect impacts of tourism and inadequate use of natural resources both on land and in the sea. The coastal zone is the main target of tourism development and recreational use. However, the depletion of freshwater aquifers, sewage and waste are equally worrisome. In the marine realm, the combination of overuse of several species, alien invasive species, destructive harvesting practices, land and seaborne pollution and worrying broader trends in the Mesoamerican Reef in terms of bleaching and acidification have changed the ecosystem and are likely to induce further damage if unaddressed.

▶ Tourism/ Recreation Areas
High Threat
Inside site
Outside site

Poorly planned and controlled tourism and development of related infrastructure, such as roads, fishing lodges, clubs, small hotels, vacation homes, cabins and trailer parks, negatively impact on natural habitats, especially in the coastal zone. Inappropriate recreational activities include hunting, fishing and harvesting, as well as use of off-road vehicles, resulting in disturbance and physical. Damage to reefs is caused by inexperienced divers (Con Pro, 2011; CONANP, 2007). Mass tourism in the vicinity of Tulum and Cancun, two of Yucatan’s major tourist attractions and associated coastal urbanisation with well-documented water, garbage and sewage problems, require monitoring and management responses. The water demands outstrip the capacity of the freshwater aquifer, thereby causing its depletion and affecting the delicate water composition of the coastal lagoons (Con Pro, 2011; CONANP, 2007). No cruise ships have been arriving at the Sian Ka’an Biosphere Reserve so far. Nevertheless, cruise ship tourism is increasing at Majahual (located at the southern edge of the property); which could cause an increase of visitor’s numbers at the southern coast in the medium and long term.
**Fishing / Harvesting Aquatic Resources, Subsistence hunting**

*High Threat*
*Inside site*
*Outside site*

Overfishing is well documented in the entire reef and aggravated by competition with and predation from the invasive Lionfish (Healthy Reefs for Healthy People, 2012; Con Pro, 2011; CONANP, 2007). Despite encouraging management improvements, the high demand for Spiny Lobster puts major pressure on this species. In some areas harvesting techniques continue to be destructive. In response to population declines of Queen Conch, harvesting of that species has been banned but continues illegally. On land, illegal hunting affects wildlife populations near settled areas (Con Pro, 2011; CONANP, 2007).

**Water Pollution**

*High Threat*
*Inside site*
*Outside site*

High levels of chemicals and heavy metals have been detected in the coastal marine environment and brackish water wetlands. Garbage piled up on the coast, in particular plastic debris, is suspected to come from coastal shipping and poor waste management but also appears to stem from remote sources (Con Pro, 2011; CONANP, 2007). Household sewage and waste water are not being disposed of properly and are polluting freshwater, brackish water, and marine environments (Con Pro, 2011; CONANP, 2007).

**Crop production**

*High Threat*
*Inside site*
*Outside site*

Watersheds are being degraded by conversion of land for agriculture, forestry, tourism and excessive use of agrochemicals (Con Pro, 2011; CONANP, 2007).

**Invasive Non-Native/ Alien Species**

*Very High Threat*
Several invasive species, such as Casuarina and coconut palms in the coastal zone, displace native flora (Con Pro, 2011; CONANP, 2007). Massive invasion by Lionfish in the marine realm (NOAA, 2012).

**Storms/Flooding**

The property is impacted on a regular basis by severe tropical storms. While a natural factor, the anthropogenic modifications in the coastal zone can aggravate the impacts (Con Pro, 2010; CONANP, 2007). Reef and mangrove protection are the best investment in reducing the vulnerability, risks and costs. Increases in temperatures and droughts are increasing the occurrence and severity of fires (SoOUV, 2013; Con Pro, 2011; CONANP, 2007).

**Potential Threats**

There is a fine line between current and potential threats in the marine and coastal environments due to cumulative effects. The most severe potential threats on land are likely to stem from expected sea level rise, while higher temperatures are likely to aggravate ocean acidification.

**Chemical changes in oceanic waters, Temperature changes**

Sian Ka’an is on the “hotlist” of 12 biodiversity World Heritage sites projected to be most impacted by climate change; in the case of Sian Ka’an due to anticipated sea level rise. Higher sea temperatures and ocean acidification are expected to have devastating effects on coral reefs and all calcifying organisms (IUCN, 2011; Con Pro, 2011, CONANP, 2007).
Protection and management

Assessing Protection and Management

▶ Relationships with local people
Some Concern

Good relations have been established with organized groups such as fishing and lobster harvesting cooperatives and several small-scale tourism operators. Relationships with marginalized and not formally organized residents and resource users continue to be difficult, and they have been generally been left out of management processes (Brenner and Vargas, 2010; Brenner and Job, 2012).

▶ Legal framework and enforcement
Some Concern

▶ Integration into regional and national planning systems
Some Concern

The management of the property is partially integrated into planning for the national system of protected areas (CONANP, 2007). While there is good coordination in terms of the contiguous "Arrecifes de Sian Ka’an Biosphere Reserve" and the "Área de Protección de Flora y Fauna Uaymil" coordination with other sectors, such as archaeology and culture, and other marine and terrestrial protected areas nearby leaves much room for improvement.

▶ Management system
Mostly Effective

The Reserve is managed by CONANP based on a Conservation and Management Program outlined in 2007, and Annual Operations Plans.
Activities are coordinated with international and local NGOs, other national and state management agencies, and national and foreign academic institutions (Con Pro, 2010; CONANP, 2007).

▶ **Management effectiveness**  
*Data Deficient*

Indicators of trends in threat levels in the marine and terrestrial environments, and of the condition of conservation targets seem to demonstrate that management has been improving in recent years (World Heritage Centre, 2001; Weinig, 2009). Data is deficient with respect to actual evaluations of management effectiveness.

▶ **Implementation of Committee decisions and recommendations**  
*Some Concern*

The State Party has responded to Committee decisions of 2002 with respect to regulation of tourism development, though it did not submit a full State of Conservation Report as requested in 2004. (whc.unesco.org).

▶ **Boundaries**  
*Some Concern*

The boundaries of the property follow natural features as much as possible and are relatively well known by local communities (CONANP, 2007). However, the fact that the contiguous "Arrecifes de Sian Ka'an Biosphere Reserve" is not inscribed as part of the World Heritage is little known and creates confusion.

▶ **Sustainable finance**  
*Mostly Effective*

Finance for management of the property is provided by regular government budgets, the national protected area fund, and international, national and local projects. A Trust Fund for protected areas of Quintana Roo State is being developed (Con Pro, 2010; CONANP, 2007).

▶ **Staff training and development**  
*Data Deficient*
Capacity building for management agencies and personnel is part of the current Conservation and Management Program (Con Pro, 2010, CONANP, 2007). Data is deficient on the degree to which it has been implemented.

► **Sustainable use**
  **Serious Concern**

Sustainable use is inherent to the biosphere reserve concept and being promoted by multiple projects and management activities (Con Pro, 2010, CONANP, 2007). Despite progress, for example as regards the management of Spiny Lobster, population declines of target species indicate inappropriate harvesting levels.

► **Education and interpretation programs**
  **Data Deficient**

Environmental education programs are part of the current Conservation and Management Program. Data is deficient on the degree to which it has been implemented.

► **Tourism and interpretation**
  **Data Deficient**

Tourism management and the development of interpretive materials are part of the current Conservation and Management Program (Con Pro, 2010, CONANP, 2007). While there are encouraging efforts to establish local tour operators to capture niche markets, overall data is deficient.

► **Monitoring**
  **Data Deficient**

Monitoring of indicators of threat reduction and the state of conservation targets is on-going. A monitoring system for activities outlined in the Conservation and Management Program has been proposed, but data is deficient on the degree to which it has been implemented (Con Pro, 2010, CONANP, 2007).
Research

Mostly Effective

Considerable research has been undertaken in the Reserve on wildlife, terrestrial and marine ecology, geology and hydrology over many years. Data from 2008 indicate that 31 different research projects were underway on fisheries, tourism, fauna, forests, coral reefs, reserve governance, and fresh water fish which involved local, national, and foreign academic institutions (WDPA, 2011; Lasch, 2009). Development of an integrated research program is proposed in the Conservation and Management Plan for the Reserve, but data is deficient on the degree to which it has been implemented.

Overall assessment of protection and management

Some Concern

The establishment of Sian Ka'an has made a marked difference on a coastline massively transformed since the arrival of mass tourism. At the same time, the property is not immune to the direct and indirect impacts of such broader developments and management has little influence on such developments. However, the challenges are well understood and significant efforts are being undertaken to overcome them.

Assessment of the effectiveness of protection and management in addressing threats outside the site

Some Concern

Threats outside the site are those related to deforestation for subsistence agriculture and livestock, and it is proposed in the Conservation and Management Plan that these threats be addressed (Con Pro, 2010, CONANP, 2007). However, data is deficient on the degree to which these activities have been implemented.

State and trend of values

Assessing the current state and trend of values
World Heritage values

► Scenic beauty of mosaic of landscape elements
   Low Concern
   Trend: Deteriorating

While overall there is low concern for the state of natural phenomena, there is high concern with respect to scenic beauty because of uncontrolled coastal development (ConPro, 2010; CONANP, 2007).

► Fascinating variety of life forms
   Low Concern
   Trend: Deteriorating

Overall, there is concern for the state and trend of biological diversity and threatened species, though the rating is somewhat different among conservation targets. The rating for freshwater and brackish water wetlands, bays and seagrass beds, and terrestrial apex predators pumas and jaguars is good. There is relatively low concern for tropical forests, while there is high concern for coral reefs, beaches and coastal dunes (Healthy Reefs for Healthy People, 2012; Con Pro, 2010; CONANP, 2007).

Other important biodiversity values

► Other international designations

The Park lies within a Conservation International-designated Conservation Hotspot, a WWF Global 200 Eco-region, and both a Ramsar Wetland of International Importance and a UNESCO Biosphere Reserve (WDPA, 2011).

► Integral component of the system of mangroves, seagrass beds and coral reefs of Mesoamerica

It deserves to be noted that Sian Ka’an belongs to an important and relatively intact part of the Mesoamerican Reef, a marine area of global conservation significance. The reef has attracted a lot of national and international attention. It is functionally and ecologically linked with the coastal mangroves and the seagrass beds. In this context, it is noteworthy that the property is part of a larger conservation complex which is contiguous
with two additional protected areas, "Área de Protección de Flora y Fauna Uaymil" and "Reserva de la Biosfera Arrecifes de Sian Ka’an". Despite the slightly confusing identical name the latter protected area established to conserve the coral reefs is not part of Sian Ka’an Biosphere Reserve and also not included in the World Heritage property.

Summary of the Values

▶ Assessment of the current state and trend of World Heritage values

Low Concern
Trend: Deteriorating

Due to its large size and relatively difficult access, large parts of the property continue to be in a good state of conservation. Despite an overall good state of the World Heritage values related to natural beauty, there is a concern with respect to the coastal zone, which is affected by uncontrolled development and plastic debris. Key concerns in terms of overall trends are the depletion and contamination of freshwater resources and the uncontrolled use of certain marine and terrestrial species.

Additional information

Key conservation issues

▶ Impacts of tourism development and population growth

Local

Tourism development and population growth have caused a large number of direct and indirect impacts such, as a lowering of the freshwater aquifer, pollution, degradation and fragmentation of habitats, and increased fire risk in addition to compromising the scenic beauty of the coast (CONANP, 2007).

▶ Climate change and severe weather events

Global

Sian Ka’an is on the “hotlist” of 12 biodiversity World Heritage sites projected
to be most impacted by climate change, and in the case of Sian Ka’an because of sea level rise. Anticipated higher sea temperatures and related ocean acidification are expected to have devastating effects on coral reefs and all calcifying organisms (IUCN, 2011; Con Pro, 2011, CONANP, 2007).

► Alien Invasive Species
  Regional

Exotic Lionfish populations are spreading throughout the Caribbean preying on and competing with native species (NOAA, 2012).

► Apparent impacts from marine traffic
  Local

Marine pollution from chemicals and garbage has been detected, and it is suspected that this comes as one of the impacts of marine traffic, and the circulation of pollutants and garbage by marine currents (CONANP, 2007).

► Unsustainable use of natural resources
  Local

Land conversion to tourism and agriculture, unsustainable agricultural and livestock husbandry systems, overfishing, and illegal hunting all lead to a degradation of the resource base of the reserve (Con Pro, 2011; Lash, 2009; CONANP, 2007).

Benefits

Understanding Benefits

► Outdoor recreation and tourism

Tourism is a driver of the local and national economy and largely based on the natural resources of the coast.

► Importance for research

As a biosphere reserve, the site is of great importance for developing and transmitting knowledge of conservation and sustainable use; and the Maya
civilization that has been inhabiting and continues to inhabit the area and continues to use the natural resources of the property and its surroundings.

▶ **Legal subsistence hunting of wild game, Collection of wild plants and mushrooms, Fishing areas and conservation of fish stocks**

The natural and cultural resources of the property provide the basis for the development of livelihoods of a significant portion of inhabitants.

**Summary of benefits**

At the national and global levels, the benefits of Sian Ka'an most valued are conservation and the generation of knowledge, while at the local level the property is most valued as a provider of livelihoods for local communities and a key resource for tourism development.

**Projects**

**Compilation of active conservation projects**
