Pitons Management Area

2017 Conservation Outlook Assessment

SITE INFORMATION

Country:
Saint Lucia
Inscribed in: 2004
Criteria:
(vii) (viii)

Site description:

The 2,909-ha site near the town of Soufriere includes the Pitons, two volcanic spires rising side by side from the sea (770 m and 743 m high respectively), linked by the Piton Mitan ridge. The volcanic complex includes a geothermal field with sulphurous fumeroles and hot springs. Coral reefs cover almost 60% of the site’s marine area. A survey has revealed 168 species of finfish, 60 species of cnidaria, including corals, eight molluscs, 14 sponges, 11 echinoderms, 15 arthropods and eight annelid worms. The dominant terrestrial vegetation is tropical moist forest grading to subtropical wet forest, with small areas of dry forest and wet elfin woodland on the summits. At least 148 plant species have been recorded on Gros Piton, 97 on Petit Piton and the intervening ridge, among them eight rare tree species. The Gros Piton is home to some 27 bird species (five of them endemic), three indigenous rodents, one opossum, three bats, eight reptiles and three amphibians. © UNESCO
SUMMARY

2017 Conservation Outlook

Finalised on 09 Nov 2017

SIGNIFICANT CONCERN

The conservation outlook for the values related to volcanic features and geological processes is good as these are robust and little affected by human activities. The outlook for the aesthetic values of the property is of high concern and has been declining because of poorly controlled development within the site. The pressure from tourism and housing development coincided with the absence of a structured and enforced development control system and has been aggravated by limited financial and technical management capacity. The recently completed Limits of Acceptable Change (LAC) study provides important guidance for the management of the site, particularly with respect to the development pressures, thus the integration of the developed guidelines into relevant legislative frameworks and their complete implementation will be essential for the protection of the site’s values.

Current state and trend of VALUES

High Concern
Trend: Data Deficient

The degradation of the aesthetic values of the Property is caused mainly by the construction of homes and resorts on the slopes of the Pitons. The physical attributes related to volcanic features and geological processes are not threatened. Together the current state of the site’s values can be assessed as “high concern”.

Overall THREATS

Very High Threat

The Pitons Management Area is one of the smallest natural World Heritage properties which currently faces a combination of development pressure associated with tourism and housing. Road construction and associated
quarrying, and occasional timber extraction and charcoal burning increase erosion and the transport of sediments into the near shore marine environment. Multiple effects of climate change represent another critical threat facing the PMA.

**Overall PROTECTION and MANAGEMENT**

**Some Concern**

The property faces a combination of tourism and housing development pressures which coincide with the absence of a structured and enforced development control system and is aggravated by limited financial and technical management capacity. The recently completed LAC study provides important guidance for the management of the site, particularly with respect to the development pressures, thus the complete implementation of the study’s guidelines will be essential for the protection of the site’s values. However, the incorporation of the recommendations of the Limits of Acceptable Change study into enforceable legislation remains to be completed. Protection and management is, however, effective for the marine component.
FULL ASSESSMENT

Description of values

Values

World Heritage values

► Superlative natural beauty
  Criterion:(vii)

The Pitons Management Area derives its primary visual impact and aesthetic qualities from the Pitons, two adjacent forest-clad volcanic lava domes rising abruptly from the sea to heights greater than 700m. The Pitons provide a distinctive landmark for seafarers. The combination of the Pitons against the backdrop of green tropical vegetation and a varying topography combined with a marine foreground gives the area its superlative beauty.
(28COM.14B.11.PitonsMA.Inscription)

► Volcanic features
  Criterion:(viii)

The Pitons Management Area contains the greater part of a collapsed stratovolcano contained within the volcanic system, known to geologists as the Soufriere Volcanic Centre. Prominent within the volcanic landscape are two eroded remnants of lava domes, Gros Piton and Petit Piton. The Pitons occur with a variety of other volcanic features including cumulodomes, explosion craters, pyroclastic deposits (pumice and ash), and lava flows. Collectively, these fully illustrate the volcanic history of an andesitic composite volcano associated with crustal plate subduction.
(28COM.14B.11.PitonsMA.Inscription)
Other important biodiversity values

▶ Marine habitats

The Marine Management Area within the PMA is a coastal strip 11 km long and about 1 km wide. It comprises a steeply sloping continental shelf with fringing and patch reefs, boulders and sandy plains. The coral reefs, which cover almost 60% of the nominated marine area, are healthy and diverse. A survey to a depth of 20 m revealed 168 species of finfish, 60 species of cnidaria including corals, 8 molluscs, 14 sponges, 11 echinoderms, 15 arthropods and 8 annelid worms. Hawksbill turtles are seen inshore, and whale sharks and pilot whales offshore (IUCN Evaluation. 2004).

▶ Terrestrial species of conservation concern

At least 148 plant species have been recorded on Gros Piton and 97 on Petit Piton and the intervening ridge. Among these are several endemic or rare plants, including eight rare species of tree. Some 27 bird species, including 5 endemics, are known from Gros Piton, along with 3 indigenous rodents, 1 opossum, 3 bats, 8 reptiles and 3 amphibians. The endemic St Lucia anole Anolis luceae, St Lucia pygmy gecko Sphaerodactylus microlepis, St Lucia boa Constrictororophias, and St Lucia viper (or fer-de-lance) Bothrops caribbaeus occur (IUCN Evaluation, 2004; IBA Information Sheet).

▶ International Bird Area

This IBA is important for its population of the Endangered St Lucia Black Finch Melanospiza richardsoni, and for the 14 (of the 23) Lesser Antilles EBA restricted-range birds that occur (including the Near Threatened St Lucia Oriole Icterus laudabilis). The endemic subspecies of Lesser Antillean Flycatcher Myiarchus oberi santaeluciae and House Wren Troglodytes aedon martinicensis also occur. A small but regionally important population of Royal Tern Sterna maxima breeds here. (IBA Information Sheet).
Assessment information

Threats

Current Threats

Very High Threat

The Pitons Management Area is one of the smallest natural World Heritage properties which currently faces a combination of development pressure associated with tourism and housing. Road construction and associated quarrying, and occasional timber extraction and charcoal burning increase erosion and the transport of sediments into the near shore marine environment. Multiple effects of climate change represent another critical threat facing the PMA.

Roads/ Railroads

Very High Threat

Inside site, localised(<5%)
Outside site

Road construction and associated quarrying, small scale subsistence farming, and occasional timber extraction and charcoal burning increases erosion and the transport of sediments into the near shore marine environment. This in turn negatively affects reef environments by contributing to coral mortality. (IUCN Evaluation, 2004; IUCN Mission Report, 2010)

Solid Waste

Low Threat

Inside site

The disposal of solid wastes along the coastline has a negative impact on the aesthetics of the Property. (IUCN Evaluation, 2004).

Fire/ Fire Suppression

Low Threat
Inside site

Because of a particularly dry season, several bush fires occurred within the property. A large fire occurred in 2010, devastating part of the hill above the Sulphur Springs. This threat periodically affects the property’s backdrop of green tropical vegetation and could become more important due to climate change (Mission Report 2010).

▶ Invasive Non-Native/ Alien Species

**Low Threat**

*Inside site, localised (<5%)*

Invasive plant species have spread in the property through the main track trail. Significant efforts to eradicate invasive alien species have been made, and include increasing the general public, local landholders and tourist businesses awareness on floristic issues (Forestry Department Union St.Lucia, 2012; World Heritage Committee, 2016).

▶ Droughts, Storms/Flooding, Chemical changes in oceanic waters

**Very High Threat**

*Inside site, throughout (>50%)*

The impacts of climate change are cumulative for both terrestrial and marine environments. Terrestrial environments are affected by increased frequency and severity of droughts, fires, tropical storms and hurricanes, the latter causing flooding and wind damage. Marine environments, and especially coral reefs, are negatively affected by ocean acidification, which contributes to coral mortality; periodic coral bleaching events caused by rises in sea temperatures; and increased frequency and severity of tropical storms and hurricanes leading to increased runoff and sedimentation; and physical damage by wave action and storm surge. (IUCN Evaluation, 2004; IUCN Mission Report, 2010)

▶ Tourism/ Recreation Areas

**Very High Threat**

*Inside site, scattered (5-15%)*

*Outside site*

The construction of vacation homes and resort on the slopes of the iconic Pitons are degrading aesthetic values and threatening the OUV of the
property. While a moratorium on development is theoretically in place, strict conditional approvals have been granted for developments that would enhance the tourism product. Now that the Limits of Acceptable Change Study has been completed and gives clear recommendations about the acceptability of proposed and future developments, it will be essential that these recommendations are fully obliged by and existing plans revised to meet the requirements. The recommendations of the LAC study were endorsed by Executive Order (Cabinet Conclusion No. 527 of 2013) and outlined a road map for implementation of the report (IUCN, Evaluation, 2004; IUCN Mission Report, 2010; 36COM.Pitons.SPreport; SOC Report 2013; SOC Report 2014). With regards to the Freedom Bay and Sugar Beach development projects, it is hoped that dialogue with developers established following the adoption of the LAC study will result in a mutually acceptable balance in line with the World Heritage status of PMA. However, the continued absence of an enforcement mechanism in case dialogue fails to generate a consensus is of concern (UNESCO, 2016).

Potential Threats

Low Threat

At the current non-invasive exploration stage of the geothermal energy project, recent findings suggest minor to no potential overlap with the property (UNESCO, 2016).

▶ Renewable Energy

Low Threat
Outside site

Concerns about location of geothermal resources within or in the immediate vicinity of the property have not materialised. However, any exploration or eventual use of geothermal energy requires adequate assessment of the potential impacts on the property (UNESCO, 2016).

Protection and management

Assessing Protection and Management
[Relationships with local people]

Some Concern

The complexity of management arrangements for the Property is reflected in the complexity of relationships with local people and the diverse range of interests. These are particularly confusing and fragmented for the terrestrial component of the Property. This is in contrast to the marine component where management arrangements are clear, stakeholders regularly participate in management decisions, and enforcement is effective. (IUCN Mission Report, 2010)

[Legal framework and enforcement]

Serious Concern

The legal framework for the terrestrial component of the Property is complex and confusing, and according to some stakeholders, enforcement is arbitrary and also subject to political influence. This contrasts with the marine component that has a clear legal framework and sound enforcement. (IUCN Mission Report, 2010; PMA - Soufrière Region Integrated Management Plan, 2008; PMA Management Plan, 2003). The Limits of Acceptable Change (LAC) study was adopted by the Cabinet of Ministers in 2015 and the process for integration of its recommendations into the legislative and institutional framework has commenced (State Party of Saint Lucia, 2015). However, this process remains to be completed (World Heritage Committee, 2016).

[Enforcement]

Serious Concern

Regarding development projects, it is expected that dialogue with developers will result in a mutually acceptable balance in line with the World Heritage status of PMA, however the continued absence of an enforcement mechanism, in case dialogue fails to generate a consensus, is of concern (UNESCO, 2016).

[Integration into regional and national planning systems]

Mostly Effective

The Property is well integrated into the national planning framework, and a
Management system

Some Concern

Management of the PMA is guided through a statutory PMA Management Plan. Implementation is based on the inputs of a large number of government departments and stakeholder groups. In practice, however, the Plan has failed to address the requirements for sustainable development of the PMA. A subsequent Integrated Development Plan and Specific Development Guidelines for the Property have not halted the construction of unsightly and intrusive buildings in critical areas. (IUCN Mission Report, 2010). In 2015, Terms of Reference for undertaking a review of the PMA Management Plan were being developed by the PMA Office as (State Party of Saint Lucia, 2015); however, the current status of this process is unclear.

Management effectiveness

Some Concern

Management effectiveness for the terrestrial component is low because of the fragmentation of responsibilities, the lack of effective coordination, and political pressure. Management of the marine component is effective. (IUCN Mission Report, 2010; PMA - Soufrière Region Integrated Management Plan, 2008; PMA Management Plan, 2003). The adoption of the LAC study can provide a framework for strengthening management protocols (State Party of Saint Lucia, 2015) and therefore improving the overall management effectiveness.

Implementation of Committee decisions and recommendations

Mostly Effective

Some Committee decisions have been implemented, while others have not. The Moratorium on development within the PMA has only partially been met. The study to determine the Limits of Acceptable Change, to review land use plans and development and control guidelines has been completed and needs to be fully implemented by the State Party. A draft statement of OUV has been submitted as has a report on the state of conservation of the
property. (36COM.PitonsMA.SPreport; Pitons MA .Agreement, MPDE-IUCN, 2011; IUCN Mission Report, 2010; SOC Report 2014). The State Party continues to address the requests and recommendations expressed by the World Heritage Committee. The review of the progress achieved with implementing the most recent Decision (40COM 7B.77) will be undertaken by the World Heritage Committee at its 42nd Session in 2018 (World Heritage Committee, 2016).

► **Boundaries**
  **Mostly Effective**

The LAC study recommended changes and adjustments to some of the property’s internal boundaries as a means of strengthening management protocols, including some modifications to Policy areas which represent a zoning mechanism in the property (State Party of Saint Lucia, 2015).

► **Sustainable finance**
  **Some Concern**

Finance for management activities is provided indirectly by the government through the allocations to the various government agencies and committees that are part of the management structure. This is not enough, however, to cover an integrated approach to management. (IUCN Mission Report, 2010; PMA - Soufrière Region Integrated Management Plan, 2008; PMA Management Plan, 2003;

► **Staff training and development**
  **Serious Concern**

The PMA is still inadequately staffed.

► **Sustainable use**
  **Serious Concern**

A number of new structures, both legal and illegal, are negatively impacting the OUV of the property and thus are uses that are unsustainable. The construction of new resorts that have received Cabinet approval in principle would further add to the problem. (IUCN Mission Report, 2010)
Education and interpretation programs
Mostly Effective

Importance of raising awareness and providing better educational opportunities been recognised and there are plans to improve current provisions. A number of initiatives to increase public awareness of the values of the property have been commenced, including preparation of brochures and other materials and organization of community events (State Party of Saint Lucia, 2015).

Tourism and interpretation
Data Deficient

The park attracts over 200,000 visitors annually and employs over 40 permanent staff (Soufriere Regional Development Foundation, 2017).

Monitoring
Mostly Effective

Monitoring of the marine component of the Property is carried out on a regular basis by the staff of the Soufriere Marine Management Association (SMMA). With regards to the values of the property associated with criterion (vii), viewpoint monitoring was recommended as a key monitoring method by the LAC study and consists of comparing photographic evidence of outstanding viewpoints with baseline photographs of same locations taken in 2013. Personnel and equipment for conducting this monitoring have been secured (State Party of Saint Lucia, 2015).

Research
Some Concern

Research on the marine component is promoted and coordinated by the SMMA, and carried out by external researchers. (SMMA website).

Data is deficient with respect to research in the terrestrial component of the property.
Overall assessment of protection and management

Some Concern

The property faces a combination of tourism and housing development pressures which coincide with the absence of a structured and enforced development control system and is aggravated by limited financial and technical management capacity. The recently completed LAC study provides important guidance for the management of the site, particularly with respect to the development pressures, thus the complete implementation of the study’s guidelines will be essential for the protection of the site’s values. However, the incorporation of the recommendations of the Limits of Acceptable Change study into enforceable legislation remains to be completed. Protection and management is, however, effective for the marine component.

Assessment of the effectiveness of protection and management in addressing threats outside the site

Some Concern

An Integrated Development Plan for the PMA and Soufriere Region was developed in 2008, but has not been implemented. The IUCN Monitoring Mission of 2010 found that there was no unifying vision for sustainable development of the region, nor mechanisms in place to address threats from outside the region. (IUCN Mission Report, 2010; PMA - Soufrière Region Integrated Management Plan, 2008).

Best practice examples

The setup and functioning of the Soufriere Marine Management Association provides good examples of best practice with respect to stakeholder participation and coordination, marine zoning, public outreach, law enforcement, and monitoring in the small island context.

State and trend of values

Assessing the current state and trend of values
World Heritage values

▶ Superlative natural beauty

Critical
Trend: Deteriorating

The natural beauty of the Property is negatively affected by the construction of vacation homes and resorts on the slopes of the Pitons. While a moratorium on development is theoretically in place, strict conditional approvals have been granted for developments that would enhance the tourism product. Though the development of regulations and guidelines for new construction is underway, they have not yet been adopted nor implemented. Aesthetic values are also affected, though much less so, by small scale farming, timber extraction, charcoal burning, fires, and grazing by goats.

▶ Volcanic features

Good
Trend: Stable

The physical attributes of the PMA that relate to earth’s history and geological processes are not threatened.

Summary of the Values

▶ Assessment of the current state and trend of World Heritage values

High Concern
Trend: Data Deficient

The degradation of the aesthetic values of the Property is caused mainly by the construction of homes and resorts on the slopes of the Pitons. The physical attributes related to volcanic features and geological processes are not threatened. Together the current state of the site’s values can be assessed as “high concern”.

▶ Assessment of the current state and trend of other important
biodiversity values
Data Deficient
Trend: Data Deficient

Data regarding the severity and trends of degradation of the marine environment, especially coral reefs, and the conservation status of terrestrial species of conservation concern is deficient. The conservation of marine habitats is not a primary objective for management of the property, per se, but rather is an indirect objective because it contributes to the maintenance of the aesthetic values of the marine component of the Property. Road, housing, and resort construction, small scale subsistence farming, and occasional timber extraction and charcoal burning all expose soils, increase erosion, and facilitate the transport of sediments into the near shore marine environment. This in turn negatively affects reef environments by contributing to coral mortality. Marine environments, and especially coral reefs, are also negatively affected by climate change, especially through ocean acidification, which contributes to coral mortality; periodic coral bleaching events caused by rises in sea temperatures; and greater severity and frequency of tropical storms and hurricanes leading to increased runoff and sedimentation and physical damage by wave action and storm surge. However, data regarding the severity and trends of these threats is deficient. (IUCN, Evaluation, 2004; IUCN Mission Report, 2010)

Additional information

Benefits

Understanding Benefits

- Outdoor recreation and tourism

The iconic PMA is a major tourism attraction for St. Lucia and the Caribbean that draws tourists from many parts of the world, and is a key element supporting economic development. (IUCN Mission Report, 2010; PMA - Soufrière Region Integrated Management Plan, 2008; PMA Management Plan,
Sacred natural sites or landscapes

Summary of benefits

Tourism and national pride are the major benefits associated with the PMA. This has the double benefit of feeding both economic development and national identity.
