Ilulissat Icefjord

SITE INFORMATION

Country:
Denmark
Inscribed in: 2004
Criteria:
(vii) (viii)

Site description:
Located on the west coast of Greenland, 250 km north of the Arctic Circle, Greenland’s Ilulissat Icefjord (40,240 ha) is the sea mouth of Sermeq Kujalleq, one of the few glaciers through which the Greenland ice cap reaches the sea. Sermeq Kujalleq is one of the fastest (19 m per day) and most active glaciers in the world. It annually calves over 35 km3 of ice, i.e. 10% of the production of all Greenland calf ice and more than any other glacier outside Antarctica. Studied for over 250 years, it has helped to develop our understanding of climate change and icecap glaciology. The combination of a huge ice-sheet and the dramatic sounds of a fast-moving glacial ice-stream calving into a fjord covered by icebergs makes for a dramatic and awe-inspiring natural phenomenon. © UNESCO
SUMMARY

2014 Conservation Outlook

Good with some concerns

There are currently no serious concerns regarding the World Heritage values of the site. The main current threats include impact from tourism; fishing, boat traffic and helicopter flights, but the management authorities are addressing all current threats efficiently. However climate change could seriously affect the site’s values in the future.

Current state and trend of VALUES

Low Concern
Trend: Stable

The site’s World Heritage values are well preserved despite the rapid increase in tourism. However there is more serious concern about the future impacts of the climate change on the glacial landscape and natural phenomenon of glacial calving.

Overall THREATS

Low Threat

The main current threats include impact from tourism; fishing, boat traffic and helicopter flights. There are currently no serious concerns and the managing authorities are addressing all current threats efficiently. However, climate change is already affecting the site and will most likely have even larger impact in the future.

Overall PROTECTION and MANAGEMENT

Mostly Effective

The site appears to be well managed; however, there is a lack of recent information on certain aspects. Threats which can be controlled by the managing
body are limited and are well under control.
FULL ASSESSMENT

Description of values

Values

World Heritage values

▶ The only remnant in the Northern Hemisphere of the continental ice sheets from the Quaternary Period
Criterion:(viii)

The Ilulissat Icefjord is an outstanding example of a stage in the Earth’s history: the last ice age of the Quaternary Period. The ice-stream is one of the fastest (19m per day) and most active in the world. Its annual calving of over 40 cu. km of ice accounts for 10% of the production of all Greenland calf ice, more than any other glacier outside Antarctica (Joughin et al 2013). The glacier has been the object of scientific attention for 250 years and, along with its relative ease of accessibility, has significantly added to the understanding of ice-cap glaciology, climate change and related geomorphic processes (Justification for inscription, 2004). The ice cap formed during the Middle and Late Pleistocene over a once temperate landscape, the south central part of which drained through large rivers to Disko Bugt, still marked as channels under the ice and submarine troughs. The ice cap’s oldest ice is estimated to be 250,000 years old, maintained by an annual accumulation of snow matched by loss through calving and melting at the margins. The ice cap holds a detailed record of past climatic change and atmospheric conditions (in trapped air bubbles) for this entire length of time, and shows that during the last ice age the climate fluctuated between extreme cold and warmer periods.

▶ Natural spectacle
Criterion:(vii)
The combination of a huge ice sheet and a fast moving glacial ice-stream calving into a fjord covered by icebergs is a phenomenon only seen in Greenland and Antarctica. Ilulissat offers both scientists and visitors easy access for close view of the calving glacier front as it cascades down from the ice sheet and into the ice-choked fjord. The wild and highly scenic combination of rock, ice and sea, along with the dramatic sounds produced by the moving ice, combine to present a memorable natural spectacle (Justification for Inscription, 2004). It is the most prolific and fastest ice-calving tidewater glacier (glaciers that calve into the sea) in Greenland producing a constant procession of icebergs and still actively eroding the fjord bed.

**Other important biodiversity values**

▶ **Arctic vegetation**

The flora of the area is a low-arctic type, typical of the nutrient-poor silicaceous soil which, where humid, shows solifluction an effect such as frost boils. Colonization of the margins of retreating ice also provides examples of plant succession. The main plant communities of the area are heath, fell-field, snow-patch, herb-slope, willow-scrub, fen, river-bank, seashore and aquatic (WHC website, retrieved 14.04.2014)

▶ **Sea life**

The upwelling caused by calving icebergs brings up nutrient-rich water which supports prolific invertebrate life and attracts great numbers of fish, seals and whales that feed on the generated nutrients. 20 species of fish have been recorded in the area; the dominant species is the flatfish Greenland halibut which feeds mainly on northern shrimp and euphausid crustaceans. The halibut migrates seasonally in and out of the fjord, living both on the benthos and in the open sea. Warmer waters bring the Atlantic cod, ringed seal and Greenland shark to the area. All three species are hunted by man and feed on the halibut. Harp seals, fin and minke whales occur in summer at the fjord mouth with very occasional blue and Greenland whales. Beluga visit
Disko Bugt in autumn and winter (WHC website, retrieved 14.04.2014).

▶ **Sea birds**

The seabirds are typical for the area, with numerous breeding colonies attracted by the high primary productivity of the glacier front, and by fish discarded by the local fishery. Large flocks of northern fulmar and gulls feed among the grounded icebergs. These are mainly Iceland gulls, glaucous gulls with lesser numbers of great black-backed gulls, kittiwakes and guillemots with great cormorant (WHC website, retrieved 14.04.2014).

▶ **Land birds and mammals**

Land birds are few and also typical for the area; there are few mammals within the locality. Arctic fox is believed to be common, whereas Arctic hare occur mainly in the higher land near the inland ice. Reindeer live only to the south of the icefjord, and polar bears are very rare visitors (WHC website, retrieved 14.04.2014).

**Assessment information**

**Threats**

**Current Threats**

**Low Threat**

The main current threats include impact from tourism; fishing, boat traffic and helicopter flights. The situation is well under control; management plan addresses most of the issues and regulations have been updated and implemented.

▶ **Shipping Lanes**

**Low Threat**
Boat traffic in the bay as well as sightseeing helicopter flights impact the spectacular aspect of the site as well as some of its biological values. The disturbance is affecting nesting birds and sea life (R5, R6, R7). Cruise ships are not permitted within the area and anchoring of boats is also prohibited.

**Tourism/ visitors/ recreation**

**Very Low Threat**

A rapid growth of tourism has been registered, from 18'000 in 2006 to 35'000 in 2008. Tourism pressure brings physical damage, such as erosion of vegetation, as well as noise and pollution from motorized vehicles, vessels and helicopters. (R7) The situation is addressed through the revised management plan and is well under control. (R7)

**Fishing / Harvesting Aquatic Resources**

**Low Threat**

Commercial fishing along Greenland coast and in the bay (R6). The quotas on halibut fisheries have been reduced and the level is considered sustainable.

**Habitat Shifting/ Alteration**

**Low Threat**

Due to global warming, the melting of the glacier is accelerating and is followed by changes in the calving front. Decrease in calving would be followed by a decrease in available food source in the bay for birds and sea life. The SP is implementing a comprehensive monitoring programme.
Potential Threats

High Threat

Climate change is the most serious threat, but is out of control of the site’s management.

▶ Tourism/ Recreation Areas

Low Threat

Insider site
Outside site

Further increase of tourism is likely to happen, but the situation is well under control (R7). New regulations have been issued and a monitoring programme is in place.

▶ Temperature changes

High Threat

Inside site
Outside site

Global warming is going to lead to significant changes in glacial landscape. This is a global issue out of control of the site’s management. There will be significant changes in the glacial landscape as well as in the vegetation and most probably animal communities.

Protection and management

Assessing Protection and Management

▶ Relationships with local people

Mostly Effective

A steering committee involving a local municipality was established in 2007 (R7, Government Order No. 10 of 15 June 2007). The management plan for the site was prepared following consultation with the local council of Ilulissat Local Authority.
Legal framework and enforcement
Mostly Effective

Good legal framework is in place; the principle legislative instrument is the 1980 Nature Conservation Act of Greenland (R2)

In 2007 the Executive Order no 10 of June 15 2007 on the protection of Ilulissat Icefiord was endorsed by the Parliament in Greenland. This was a revision of the Executive Order no 7 of March 25 2003 with following improvements:
• Traffic in Sermermiut is permitted only on designated paths in the period between April 1 and October 31.
• All navigation with vessels larger than a tonnage of 1,000 Gross Registered Tonnes is prohibited
• Anchoring and laying up boats are prohibited within the protected area
• Restrictions on pitching of tents and use of open fire (maximum 24 hours in the same locality)

Integration into regional and national planning systems
Data Deficient

DD

Management system
Mostly Effective

The Environmental and Nature Agency of Greenland is responsible for the management of the World Heritage Site and in close collaboration with Qaasuitsup Kommunia (Former the Municipality of Ilulissat), which is responsible for the day-to day management of the World Heritage Area. This management system appears efficient. (R7)

Management effectiveness
Mostly Effective

Management appears effective (R7).

Implementation of Committee decisions and recommendations
Highly Effective
Several measures have been undertaken; good response from the State Party (a detailed report was submitted 2007) (R6, R7)

**Boundaries**

*Highly Effective*

The boundary of the site has been drawn to encompass all the interdependent elements of the geological process of the Icefjord – the relevant portion of the inland icecap, the ice stream, the glacial front and the fjord. The boundary also follows the watershed of the fjord and thus incorporates the adjacent moraines, kame terraces and deltas. Excluded are the settlements of the nearby villages of Ilimanaq and Ilulissat where a de facto buffer zone is defined within the municipality plan. (R2)

**Sustainable finance**

*Highly Effective*

Funding can be considered as adequate. (R7)

**Staff training and development**

*Mostly Effective*

Staff members have been receiving necessary training (R7)

**Sustainable use**

*Some Concern*

There is little recent information on the sustainability of fishing. However, quotas on halibut appear to be sustainable (2009: 8,800 tons; R7))

**Education and interpretation programs**

*Mostly Effective*

A number of activities were planned in 2007 (R7):

Icefjord Office will accumulate and dissipate scientific popular articles about climatic changes in Ilulissat Icefjord. The Icefjord Office will spend the project funding on educational purposes to increase awareness of the values of Ilulissat Icefjord to the local community, Greenlandic public and visitors. Projected educational activities about Ilulissat Icefjord include:
Creation of a web page
National TV-broadcast
Creation of a DVD
Signposting in the World Heritage Site

As of May 2014, there is a detailed website with many information on the site, including access, research and administration.

▶ Tourism and interpretation
  Data Deficient

DD

▶ Monitoring
  Mostly Effective

A comprehensive Monitoring Plan was developed in 2007 by the Geological Survey of Denmark and Greenland (GEUS) (R7)

▶ Research
  Highly Effective

Scientific research over 150 years has made Ilulissat Icefjord and surrounds one of the best observed ice-streams in the world. (R2)
A significant and unique set of glaciological records and many scientific publications have been written about the site. The site displays most of the surface characteristics of the Greenland ice margin clearly, compactly and accessibly. From the relatively ice-free mid of 18th century onwards, the Icefjord interested many scholars who noted its fluctuations over the years. Studies, especially over the last 10-20 years using aerial photography, core drilling, deep radar sounding and satellite monitoring, have been intensive. Such research has enlarged understanding of ice-stream dynamics, glacial erosion and deposition, Quaternary geology and prehistoric climates through the examination of ice cores.
Regarding monitoring of the impacts of global climate change, Ilulissat will have much to offer in future as well.
Overall assessment of protection and management
Mostly Effective

The site appears to be well managed; however, there is a lack of recent information on certain aspects. Threats which can be controlled by the managing body are limited and are well under control.

▶ Assessment of the effectiveness of protection and management in addressing threats outside the site
   Some Concern

  Fishing and boat traffic outside of the site need to be controlled.

State and trend of values

Assessing the current state and trend of values

World Heritage values

▶ The only remnant in the Northern Hemisphere of the continental ice sheets from the Quaternary Period
   Good
   Trend: Stable

  The geological features of the site remain in good condition (R6, R7).

▶ Natural spectacle
   Low Concern
   Trend: Deteriorating

  There is a low concern about the future impacts of the climate change on the glacial landscape and natural phenomenon of glacial calving.

Other important biodiversity values

▶ Arctic vegetation

  The flora of the area is a low-arctic type, typical of the nutrient-poor
silicaceous soil which, where humid, shows solifluction an effect such as frost boils. Colonization of the margins of retreating ice also provides examples of plant succession. The main plant communities of the area are heath, fell-field, snow-patch, herb-slope, willow-scrub, fen, river-bank, seashore and aquatic (WHC website, retrieved 14.04.2014)

▶ **Sea life**

The upwelling caused by calving icebergs brings up nutrient-rich water which supports prolific invertebrate life and attracts great numbers of fish, seals and whales that feed on the generated nutrients. 20 species of fish have been recorded in the area; the dominant species is the flatfish Greenland halibut which feeds mainly on northern shrimp and euphausid crustaceans. The halibut migrates seasonally in and out of the fjord, living both on the benthos and in the open sea. Warmer waters bring the Atlantic cod, ringed seal and Greenland shark to the area. All three species are hunted by man and feed on the halibut. Harp seals, fin and minke whales occur in summer at the fjord mouth with very occasional blue and Greenland whales. Beluga visit Disko Bugt in autumn and winter (WHC website, retrieved 14.04.2014).

▶ **Sea birds**

The seabirds are typical for the area, with numerous breeding colonies attracted by the high primary productivity of the glacier front, and by fish discarded by the local fishery. Large flocks of northern fulmar and gulls feed among the grounded icebergs. These are mainly Iceland gulls, glaucous gulls with lesser numbers of great black-backed gulls, kittiwakes and guillemots with great cormorant (WHC website, retrieved 14.04.2014).

▶ **Land birds and mammals**

Land birds are few and also typical for the area; there are few mammals within the locality. Arctic fox is believed to be common, whereas Arctic hare occur mainly in the higher land near the inland ice. Reindeer live only to the south of the icefjord, and polar bears are very rare visitors (WHC website, retrieved 14.04.2014).
Summary of the Values

▷ Assessment of the current state and trend of World Heritage values
  Low Concern
  Trend: Stable

  The site’s WorldHeritage values are well preserved despite the rapid increase in tourism. However there is more serious concern about the future impacts of the climate change on the glacial landscape and natural phenomenon of glacial calving.

▷ Assessment of the current state and trend of other important biodiversity values
  Low Concern
  Trend: Data Deficient

  Sea life may be affected by boat traffic and fishing along the coast, as well as by reduction of ice calving in the bay.

Additional information

Key conservation issues

▷ Tourism
  Local

  Monitoring and control of tourism activities needs to continue.

Benefits

Understanding Benefits

▷ Outdoor recreation and tourism
Ilulissat Icefjord is the most visited site in Greenland (35'000 visitors in 2008)

**Importance for research**

The site has an outstanding record of glacial history. It has an exceptional potential for observation of the impacts from climate change.

**Projects**

---

**Compilation of active conservation projects**
