West Norwegian Fjords -
Geirangerfjord and Nærøyfjord

SITE INFORMATION

Country:
Norway
Inscribed in: 2005
Criteria:
(vii) (viii)

Site description:
Situated in south-western Norway, north-east of Bergen, Geirangerfjord and Nærøyfjord, set 120 km from one another, are part of the west Norwegian fjord landscape, which stretches from Stavanger in the south to Andalsnes, 500 km to the north-east. The two fjords, among the world’s longest and deepest, are considered as archetypical fjord landscapes and among the most scenically outstanding anywhere. Their exceptional natural beauty is derived from their narrow and steep-sided crystalline rock walls that rise up to 1,400 m from the Norwegian Sea and extend 500 m below sea level. The sheer walls of the fjords have numerous waterfalls while free-flowing rivers cross their deciduous and coniferous forests to glacial lakes, glaciers and rugged mountains. The landscape features a range of supporting natural phenomena, both terrestrial and marine, such as submarine moraines and marine mammals. © UNESCO
SUMMARY

2017 Conservation Outlook

Good

The conservation outlook of the property is good, thanks to the robustness of its values, limited threats and effective management. However, coordination between different management authorities involved in the management of the property could be improved. Some concerns also exist regarding addressing some of the threats, particularly those from cruise ships.

Current state and trend of VALUES

Good
Trend: Stable

Reflecting their relatively robust nature, limited threats and overall effective management, the conservation status of the geological and scenic values of the property is good and stable.

Overall THREATS

Very Low Threat

Current threats include mining and aquaculture, as well as cruise ship travel, harbour infrastructure development and water pollution. However, all these threats are localized and their impact on the geological and scenic features that constitute the OUV of the property appears well controlled and limited. Some of the biodiversity values of the property might, however, be more affected. Potential threats to the property are mainly from natural disasters (rock falls, avalanches), which are part of the natural dynamics of the system and do not pose a significant threat to the site’s values.
Overall PROTECTION and MANAGEMENT

Mostly Effective

Protection and management of the property are effective. However, coordination between different management authorities involved in the management of the property could be improved. Some concerns also exist regarding addressing some of the threats, particularly from cruise ships. There is a long history of research and monitoring within the property, however, these could be more focused on the site’s OUV.
Description of values

Values

World Heritage values

► Classic, superbly developed fjords
  Criterion:(viii)

The West Norwegian Fjords are archetypical, exceptionally developed fjords, considered as the most typical example of this geological phenomenon in the world. They are comparable in scale and quality to other existing fjords on the World Heritage List and are distinguished by the climate and geological setting. The property displays a full range of the inner segments of two of the world’s longest and deepest fjords, and provides well-developed examples of young, active glaciation during the Pleistocene ice age. (WHC, 2014b, UNEP-WCMC, 2011)

► Exceptional fjord landscapes
  Criterion:(vii)

The two fjords that make up this property are considered to be among the most scenically outstanding fjord complexes worldwide. They display narrow and steep-sided crystalline rock walls that rise up to 1,400 m from the sea surface and extend 500 m below sea level. Along the sheer walls of the fjords are numerous waterfalls while free-flowing rivers run through deciduous and coniferous forest to glacial lakes, glaciers and rugged mountains. There is a great range of supporting natural phenomena, both terrestrial and marine such as submarine moraines and marine mammals. (WHC, 2014b, UNEP-WCMC, 2011).
Other important biodiversity values

▶ Full range of marine, freshwater and terrestrial ecosystems of this area with their associated biota

There is a great range of supporting natural phenomena, including terrestrial, freshwater and marine. Vegetation is typical of West Norway, with both deciduous (mainly Betula spp.) and coniferous (mainly Pinus sylvestris) forest, as well as alpine formations with dwarf birch Betula spp. and polar willow (Salix Polaris). Noteworthy are the natural free-flowing river systems with their associated biota, including emblematic species such as Eurasian Otter (Lutra lutra) and Dipper (Cinclus cinclus). The terrestrial mammal fauna comprises a wide range of ungulates and carnivores typical of the region; while both harbour seals (Phoca vitulina) and porpoise (Phocoena phocoena) and several other species of cetaceans are inhabiting the sea. Ichthyofauna such as Salmon (Salmo salar) and Sea trout (S. trutta) and avifauna such as White tailed eagle (Haliaeetus albicilla) and Golden eagle (Aquila chrysaetos) are also rich and typical of this geographical setting (UNEP-WCMC, 2011).

Assessment information

Threats

Current Threats

Very Low Threat

Current threats include mining and aquaculture, as well as cruise ship travel, harbour infrastructure development and water pollution. However, all these threats are localized and their impact on the geological and scenic features that constitute the OUV of the property appears well controlled and limited. Some of the biodiversity values of the property might, however, be more affected.
Tourism/ visitors/ recreation

Low Threat
Inside site
Outside site

Increasing cruise ship traffic and visitation noted as a concern by environmental groups (News in English.no, 2009). The level of boat traffic (including rib-boats and kayaking) in the Nærøyfjord, may negatively affect the seal population through disturbing.

Marine/ Freshwater Aquaculture

Very Low Threat
Outside site

Salmon aquaculture in the wider fjord systems around the property reportedly threatening local salmon and sea trout stocks has previously been reported. Some limitations on aquaculture production are now in place (Manzetti, 2011).

Changes in traditional ways of life and knowledge systems

Very Low Threat
Inside site, extent of threat not known
Outside site

Some farmland dependent biodiversity reportedly threatened by abandonment of traditional farming (UNEP-WCMC, 2011).

Invasive Non-Native/ Alien Species

Very Low Threat
Inside site, extent of threat not known
Outside site

Spruce (Picea abies), a non-natural species occurs in the area. It is spreading from plantations, threatening biodiversity values of the site (IUCN Consultation, 2014).

Water Pollution

Low Threat
Inside site, extent of threat not known
Outside site

At least one localized significant incident of water pollution from cruise ship fuel was recorded in 2009 (News in English.no, 2009). Concerns exist around sewage and grey water. Some air pollution is also caused by cruise ships. Water and air pollution from cruise ships remains the most significant threat to the property (IUCN Consultation, 2017).

► Mining/ Quarrying

Low Threat
Outside site

A peridotite quarry is located near the Geirangerfjord component. The impacts are localized and a restoration is planned once extraction ceases. Underground extraction of anorthosite takes place in the Nærøyfjord area, and this may expand in the future. (World Heritage Committee, 2014).

Potential Threats

Very Low Threat

Potential threats to the property are mainly from natural disasters (rick falls, avalanches), which are part of the natural dynamics of the system and do not pose a significant threat to the site’s values.

► Earthquakes/ Tsunamis, Avalanches/ Landslides

Very Low Threat
Inside site, scattered(5-15%)
Outside site

Persistent risk of avalanches, rock falls and landslides exists in several parts of the property, but this is part of the natural dynamics of the area and is not seriously threatening the OUV of the property (UNEP-WCMC, 2011). This is expected to increase due to climate change.

Protection and management
Assessing Protection and Management

▶ Relationships with local people

Mostly Effective

There are more than 500 people living within the property, engaged in tourism, agriculture and also natural resource use (UNEP-WCMC, 2011). 82% of land is privately owned. Separate advisory committees for both component areas are foreseen in management plans (Møre and Romsdal County Government, 2008, County Governor of Sogn og Fjordane, 2008). Relationship with local people, landowners and tourism sector was characterized as "fair" by State Party (Periodic report, 2014).

▶ Legal framework

Mostly Effective

The terrestrial and limnic parts of the site are legally protected as county-governed Protected Landscapes and Nature Reserves. The marine part is not protected presently but the County Gouvernor of Sogn and Fjordane has started a process to protect larger parts of the Sognefjord, including the World Heritage area (IUCN Consultation, 2014). There are also legally binding local development plans and additional legal safeguards for specific parts of the areas (e.g. banning hydropower development along rivers) (UNEP-WCMC, 2011). Presently the marine part is regulated by the EU Water framework directive in addition to many other laws and regulations. Legal framework for protection of the OUV was characterized as adequate, but weaknesses in its implementation were noted by State Party (WHC, 2014a). Fragmented management system was noted as one challenge to effective implementation of legal framework (Brendehaug, 2014).

▶ Enforcement

Mostly Effective

Enforcement of relevant regulations is considered effective (IUCN Consultation, 2017).
Integration into regional and national planning systems
Mostly Effective

There is a range of planning and development mechanisms at different levels (national, county, municipal, local). Coordination between different management authorities could, however, be improved (Periodic report, 2014).

Management system
Mostly Effective

Valid management plans are in force for both components of the property (Møre and Romsdal County Government, 2008, County Governor of Sogn og Fjordane, 2008). However, the overall management system is considered only partially effective to maintain the OUV of the property by the State Party (Periodic report).

Management effectiveness
Mostly Effective

No systematic management effectiveness assessment has been undertaken. Management effectiveness was considered generally sufficient, but implementation and effectiveness gaps were noted in the Periodic Report. Shortcomings appear to exist in the area of tourism (particularly cruise ship) management and inter-institutional coordination (Brendehaug, 2014, WHC, 2014a, News in English.no, 2009).

Implementation of Committee decisions and recommendations
Highly Effective

Request from Decision 29 COM 8B.7 to monitor and report on plans to further expand mining in the area (WHC, 2005) was fulfilled (UNEP-WCMC, 2011).

Boundaries
Highly Effective

The boundaries of the property are considered adequate (UNEP-WCMC, 2011, WHC, 2014a). They are known to all relevant parties. There is no buffer zone as it is not considered necessary by the State Party (WHC, 2014a), IUCN.
(IUCN, 2005) or the World Heritage Committee (WHC, 2005).

▶ Sustainable finance
   Mostly Effective

Funding is sourced from national (60%), provincial (20%) and local government (10%) as well as other sources. It has been assessed as acceptable and secure but suboptimal by the State Party (Periodic report). Levels of funding continue to be considered below optimum (IUCN Consultation, 2017).

▶ Staff training and development
   Mostly Effective

Property managed by staff from various institutions (UNEP-WCMC, 2011). Staff qualification generally rated as good or fair by State Party, but deficits in the field of visitor management and risk preparedness have been noted. Availability of training opportunities for all relevant areas apart from the latter is sufficient (Periodic report).

▶ Sustainable use
   Highly Effective

There are 56 small farms at Nærøyfjord area (12 main farms and 24 smaller holdings still active). At Geirangerfjord there are 12 small working farms and 24 with grazing. Grazing, mainly by goats and sheep, occurs in the marginal upland valleys. Hunting is undertaken to cull deer; local fishing is now mostly recreational (UNEP-WCMC, 2011). Use appears to be sustainable and not to cause any conflicts.

▶ Education and interpretation programs
   Mostly Effective

Education and interpretation programmes as well as infrastructure exist as part of the management plans of component sites (Møre and Romsdal County Government, 2008, County Governor of Sogn og Fjordane, 2008), but could be improved according to the Periodic report. Several printed materials are available for visitors (e.g. Directorate for Cultural Heritage and
Tourism and visitation management

Some Concern

Fragmented management responsibilities were considered a challenge to effective visitor management (Brendehaug, 2014). A dedicated visitor management strategy is needed but missing and the standard of both the visitor centre and guided educational tours was considered poor in the Periodic Report, but its information booths and trail network are considered adequate (WHC, 2014a). A new visitor management plan is currently being developed (IUCN Consultation, 2014).

Monitoring

Mostly Effective

There are monitoring programmes in place for geological activity, flora and fauna, monuments, buildings and landscapes, farmland, tourism and land use has been reported (UNEP-WCMC, 2011). Monitoring was, however, considered insufficient to meet all information needs for effective management (Periodic report). Particularly, monitoring of the marine area is insufficient.

Research

Mostly Effective

A wide range of research on aspects of geology, biodiversity, ichthyology, ecology and other aspects of both components of the property has been conducted since the 18th Century (Norwegian Ministry of the Environment, 2004). The recently established International Centre for Geohazards financed by the Norwegian Research Council also has this among its focus areas. Research could be focused more strongly on the management of the OUV, according to the Periodic report (2014).

Overall assessment of protection and management

Mostly Effective

Protection and management of the property are effective. However,
Coordination between different management authorities involved in the management of the property could be improved. Some concerns also exist regarding addressing some of the threats, particularly from cruise ships. There is a long history of research and monitoring within the property, however, these could be more focused on the site’s OUV.

**Assessment of the effectiveness of protection and management in addressing threats outside the site**

**Mostly Effective**

Among relevant threats outside the property are mining and marine pollution in its vicinity, as well as potentially aquaculture which could have an impact on the biota of the property. In the absence of more specific information on this matter, it is assumed that these threats are controlled.

**Best practice examples**

Participation of local people, municipalities, landowners and resource users in the decision making, management and benefit sharing of the property - as developed throughout the nomination and foreseen in the management plans of the component sites - is exemplary and could be replicated elsewhere.

**State and trend of values**

Assessing the current state and trend of values

**World Heritage values**

**Classic, superbly developed fjords**

Good

Trend: Stable

The geological formations of the site remain very well preserved and are very robust against any possible impacts.
Exceptional fjord landscapes

Low Concern
Trend: Stable

The exceptional scenic values of the site are relatively robust against anthropogenic impacts and are not under threat currently (UNEP-WCMC; 2011), although this might change if mining is further developed at or near the property.

Summary of the Values

Assessment of the current state and trend of World Heritage values

Good
Trend: Stable

Reflecting their relatively robust nature, limited threats and overall effective management, the conservation status of the geological and scenic values of the property is good and stable.

Assessment of the current state and trend of other important biodiversity values

Low Concern
Trend: Data Deficient

Biodiversity values of the site remain in good condition and stable, but some concerns exist regarding fish species abundance and richness.

Additional information

Benefits

Understanding Benefits

Food, Fishing areas and conservation of fish stocks
There are small-scale traditional fisheries operating in the area which benefit from the property's marine biodiversity.

► Food, Traditional agriculture, Livestock grazing areas

There are 56 small farms at Nærøyfjord area (12 main farms and 24 smaller holdings still active). At Geirangerfjord there are 12 small working farms and 24 with grazing. Grazing, mainly for goats and sheep, occurs in the marginal upland valleys (UNEP-WCMC, 2011).

► Health and recreation, Outdoor recreation and tourism

The property received more than a million visitors in 2002 overall, two fifth of which arrived on cruise ships. There were about 150 cruise ship visits to each component property in the same year (UNEP-WCMC, 2011).

► Knowledge, Importance for research

The site has been an important source of scientific knowledge since the 18th Century, and has also been a source of local traditional knowledge (UNEP-WCMC, 2011).

► Knowledge, Contribution to education

Many of the numerous visitors to the property from both its vicinity and further afield use their visits to learn about the geological history of the fjord landscape, its geology and ecology, as well as associated cultural traditions.

Summary of benefits

Although it is situated in a relatively sparsely populated part of Europe, the property provides a wide range of benefits to local people, as well as to more than a million visitors from all over Norway and beyond who go there each year.
