Rock Islands Southern Lagoon

SITE INFORMATION

Country: 
Palau
Inscribed in: 2012
Criteria: 
(iii) (v) (vii) (ix) (x)

Site description: 
Rock Islands Southern Lagoon covers 100,200 ha and includes 445 uninhabited limestone islands of volcanic origin. Many of them display unique mushroom-like shapes in turquoise lagoons surrounded by coral reefs. The aesthetic beauty of the site is heightened by a complex reef system featuring over 385 coral species and different types of habitat. They sustain a large diversity of plants, birds and marine life including dugong and at least thirteen shark species. The site harbours the highest concentration of marine lakes anywhere, isolated bodies of seawater separated from the ocean by land barriers. They are among the islands’ distinctive features and sustain high endemism of populations which continue to yield new species discoveries. The remains of stonework villages, as well as burial sites and rock art, bear testimony to the organization of small island communities over some three millennia. The abandonment of the villages in the17th and 18thcenturies illustrates the consequences of climate change, population growth and subsistence behaviour on a society living in a marginal marine environment. © UNESCO
SUMMARY

2014 Conservation Outlook

Good with some concerns

Overall, the conservation outlook for the Rock Islands Southern Lagoon is optimistic. Koror State has put in place a number of excellent management practices to protect the values of the Rock Islands Southern Lagoon. Potential issues include visitor impacts from large numbers of visitors to Jellyfish Lake and popular scuba dive and snorkeling spots as well as impacts associated with climate change and fishing pressure. * For mixed sites Conservation Outlook Assessments only evaluate the natural values of these sites (criteria vii, viii, ix and x) and the overall assessment reflects the potential of a site to preserve its natural values over time.

Current state and trend of VALUES

Low Concern
Trend: Stable

Overall, the current state of values is good. Coral reefs may be threatened by climate change in the future; continuing management practices to reduce other stressors such as overfishing and visitor impacts will be key.

Overall THREATS

Low Threat

Increasing tourist numbers is the most serious current threat and impacts from dive tourism are evident in some frequently visited dive sites. Potential threats include impacts from tsunamis and potential contamination from wastewater effluent. Overall, threats to the site are relatively low.
Overall PROTECTION and MANAGEMENT
Mostly Effective

Overall, the protection and management of the Rock Island Southern Lagoon is mostly effective. The legislative framework regulating use and management of the environment and its resources is comprehensive and clear and is implemented effectively. There is, however, some room for improvement in education, enforcement, and involvement of local residents.
FULL ASSESSMENT

Description of values

Values

World Heritage values

► Exceptional beauty of Rock islands
Criterion:(vii)

The maze of dome-shaped and green Rock Islands seemingly floating in the turquoise lagoon surrounded by coral reef is of exceptional aesthetic beauty (SoOUV, 2012).

► Exceptional area with high variety of habitats
Criterion:(vii)

The Rock Islands Southern Lagoon contains an exceptional variety of habitats within a relatively limited area. Barrier and fringing reefs, channels, tunnels, caves, arches, and coves, as well as the highest number and density of marine lakes in the world, are home to diverse and abundant marine life (SoOUV, 2012).

► Marine lakes and associated species
Criterion:(ix)

The Rock Islands Southern Lagoon contains 52 marine lakes, more than at any other site in the world. Furthermore, the marine lakes of the property are at different stages of geological and ecological development, ranging from lakes with high connectivity to the sea to highly isolated lakes with notably different species composition, including unique and endemic species. These features represent an outstanding example of how marine ecosystems and communities develop, and make the lakes valuable as “natural laboratories”
for scientific study of evolution and speciation (SoOUV, 2012). Five new subspecies of the Mastigias papua jellyfish have been described from the marine lakes, and new species discoveries continue to be made both in the marine lakes as well as in the complex reef habitats of the property (SoOUV, 2012).

► **Exceptionally high biological and marine habitat diversity**
  
  **Criterion:** (x)

  The Rock Islands Southern Lagoon has exceptionally high biological and marine habitat diversity. The marine lakes are unique in terms of number, the density at which they occur, and their varying physical conditions. With low fishing pressure, limited pollution and human impact, as well as an exceptional variety of reef habitat, the resilience of reefs of the property makes it a critical area for protection, including as an area important for climate change adaptation of reef biota, and potentially as a source of larvae for reefs in the region (SoOUV, 2012).

  These coral reefs are adapted to naturally acidified waters and may be uniquely resistant to ocean acidification (Shamberger et al., 2014).

► **Corals**
  
  **Criterion:** (x)

  385 species of coral are known to occur in the Rock Islands Southern Lagoon (SoOUV, 2012).

► **Fish**
  
  **Criterion:** (x)

  746 species of fish occur in the Rock Islands Southern Lagoon, including endemic and threatened species (SoOUV, 2012).

► **Terrestrial biodiversity**
  
  **Criterion:** (x)

  All of Palau’s endemic birds, mammals, herpetofauna and nearly half of Palau’s endangered plants are found in Rock Islands Southern Lagoon (SoOUV, 2012).
Sharks and turtles
Criterion: (x)

13 species of sharks and manta rays and 2 species of marine turtle listed on IUCN’s Red List are found in the Rock Islands (SoUV, 2012).

Mollusks
Criterion: (x)

7 species of giant clams and an endemic species of nautilus are found in the Rock Islands (SoOUV, 2012).

Assessment information

Threats

Current Threats
Low Threat

Increasing tourist numbers is the most serious current threat and impacts from dive tourism are evident in some frequently visited dive sites.

Fishing / Harvesting Aquatic Resources

Low Threat
Inside site
Outside site

Fishing occurs in the Rock Islands Southern Lagoon outside of no-take zones, and has been known to occur inside of no-take zones illegally. (Matthews 2004).

Tourism/ visitors/ recreation

High Threat
Impacts from dive tourism are evident in some frequently visited dive sites in the Rock Islands Southern Lagoon; numbers of tourists are continually increasing each year. (Poonian et al 2010)
Number of tourists visiting Palau increased from 58,000 in 2000 to 79,000 in 2008, and to 109,000 in 2011 (World Bank, 2012). Most of these tourists visit the Rock Islands.

Temperature changes

Climate change is one of the long-term threats in the Rock Islands; coral bleaching in 1998 bleaching event was as high as 90% at some sites, with average mortality reaching 30%. Rock Islands corals have shown excellent recovery, resulting in rating of “low threat.” (TNC, nd)

Potential Threats

Potential threats include impacts from tsunamis and typhoons and potential contamination from wastewater effluent.

Earthquakes/ Tsunamis

Typhoons are rare in Palau; however, Typhoon Bopha hit Palau in December 2012 with serious impact.

Protection and management

Assessing Protection and Management
► **Relationships with local people**  
**Mostly Effective**

Overall, the Rock Islands Southern Lagoon is a source of pride for Palauans and the management of the area is supported by local residents. However, there is room for improvement to involve local stakeholders. One project aiming to improve this is the Koror State-Rare campaign (www.rareplanet.org).

► **Legal framework and enforcement**  
**Mostly Effective**

The legislative framework regulating use and management of the environment and its resources is comprehensive and clear (SoOUV, 2012). Rules and regulations for the Rock Islands Southern Lagoon are clearly delineated in the management plan and enforced by the Koror State Rangers. Enforcement is mostly effective, with some room for improvement.

► **Integration into regional and national planning systems**  
**Mostly Effective**

Palau’s Protected Areas Network works to integrate state and national planning.

► **Management system**  
**Mostly Effective**

The area falls in its entirety in Koror State, and the management jurisdiction of Koror State Rangers is well known and respected. Management authorities are operating on relatively reliable revenue from tourism. The strength of traditional value systems including resource governance systems is an asset, and can enable management and zoning that accommodate both cultural/traditional and biodiversity conservation needs. Management objectives and priorities are defined in the Rock Islands Southern Lagoon Management Plan (SoOUV, 2012).

► **Management effectiveness**  
**Mostly Effective**
The Nature Conservancy conducted a management effectiveness evaluation of the Rock Islands Southern Lagoon in 2012; results showed that the management is mostly effective (Personal communication, 2013).

► **Implementation of Committee decisions and recommendations**
  Data Deficient

  .

► **Boundaries**
  Mostly Effective

  Boundaries are clearly delineated, with some room for improvement in boundary markers.

► **Sustainable finance**
  Highly Effective

  The Rock Islands Southern Lagoon is relatively well financed through user fees from tourists visiting the area (SoOUV, 2012).

► **Staff training and development**
  Some Concern

  Koror State Rangers receive training in law enforcement and educational enforcement. The Guam government is a partner on this. However, more training is needed.

► **Sustainable use**
  Mostly Effective

  Fishing is the main extractive industry in the Rock Islands and it is relatively well managed. However, subsistence and recreational fishing taking place within the property and in designated zones require constant monitoring (SoOUV, 2012).

► **Education and interpretation programs**
  Some Concern
A number of partners provide education programs in the Rock Islands; however, a more systemized approach to provide educational opportunities to Palau’s students would improve effectiveness.

**Tourism and interpretation**

*Some Concern*

Tourism and interpretation are carried out by private industry, with many dive shops taking tourists to the Rock Islands. Some of these dive shops have commitments to sustainability and excellent interpretation, while other dive shops have room for improvement on both (Poonian, 2010).

**Research**

*Mostly Effective*

The Palau International Coral Reef Center leads research efforts in the Rock Islands Southern Lagoon, including impacts of climate change on coral reefs (Golbuu, 2005). The site is also important for research on coral reef resistance to ocean acidification (Shamberger et al., 2014).

**Monitoring**

*Mostly Effective*

The Palau International Coral Reef Center and other partners such as the Coral Reef Research Foundation and The Nature Conservancy regularly monitor coral reefs and fish populations (Golbuu, 2005).

**Overall assessment of protection and management**

*Mostly Effective*

Overall, the protection and management of the Rock Island Southern Lagoon is mostly effective. The legislative framework regulating use and management of the environment and its resources is comprehensive and clear and is implemented effectively. There is, however, some room for improvement in education, enforcement, and involvement of local residents.

**Assessment of the effectiveness of protection and management in**
addressing threats outside the site
Some Concern

The main threat outside the site comes from climate change and acidification, which is a threat that can’t be managed locally, only mitigated.

▶ Best practice examples

Sustainable financing of enforcement efforts through relatively high user fees.

State and trend of values

Assessing the current state and trend of values

World Heritage values

▶ Exceptional beauty of Rock islands
    Good
    Trend: Stable

    The aesthetic values of the site have been well preserved.

▶ Exceptional area with high variety of habitats
    Good
    Trend: Stable

    The site remains a unique area with exceptionally high variety of habitats.

▶ Marine lakes and associated species
    Low Concern
    Trend: Stable

    Most marine lakes are not visited, which means they receive protection. The jellyfish in the main jellyfish lake are under stress due to visitor impacts.

▶ Exceptionally high biological and marine habitat diversity
    High Concern
    Trend: Data Deficient

    Coral reefs may be threatened by climate change into the future; continuing
management practices to reduce other stressors such as overfishing and visitor impacts will be key (Poonian, et. al 2010, TNC, n.d.).

► Corals
   High Concern
   Trend: Data Deficient

Coral reefs may be threatened by climate change and acidification into the future; continuing management practices to reduce other stressors such as overfishing and visitor impacts will be key (Poonian, et. al 2010, TNC, n.d.).

► Fish
   Low Concern
   Trend: Data Deficient

Reducing fishing impacts, particularly to endangered and threatened species will be important to prevent irreversible losses.

► Terrestrial biodiversity
   Data Deficient
   Trend: Data Deficient

► Sharks and turtles
   Low Concern
   Trend: Stable

Palau has abundant shark populations and recent measures to ban shark fishing (including the government declaring the EEZ as a shark sanctuary in partnership with Pew) will need strong enforcement to ensure that these species persist.

► Mollusks
   Data Deficient
   Trend: Data Deficient
Summary of the Values

▶ Assessment of the current state and trend of World Heritage values
  Low Concern
  Trend: Stable

  Overall, the current state of values is good. Coral reefs may be threatened by climate change in the future; continuing management practices to reduce other stressors such as overfishing and visitor impacts will be key.

Additional information

Benefits

Understanding Benefits

► Outdoor recreation and tourism

Tourism is about 50% of Palau’s GDP (one of the highest rates in the world), most tourists visiting the Rock Islands (IMF, 2012).

► Outdoor recreation and tourism

The Rock Islands Lagoon provides recreational opportunities for Palauans and visitors, including boating, BBQing, fishing, snorkeling, and beach visits.

► Importance for research

The Rock Islands Lagoon provides a natural laboratory for scientific research on coral reef health and climate change impacts to coral reefs and has spawned numerous scientific publications (e.g. Golbuu, 2007; Shamberger et al., 2014).

Summary of benefits

Benefits provided by the Rock Islands Lagoon include tourism, recreation, and scientific research. The primary benefit is tourism and its associated impact on Palau’s GDP.
